

OLA Data Analyst Project

Overview & Explanation of the Problem Statement

Project Overview

This project is a data analyst case study built around ride-booking data from **OLA**, a major Indian ride-hailing service (comparable to Uber). The objective is to analyze booking behaviour, cancellations, revenue, and customer/driver ratings using two complementary tools: **SQL** for structured data querying, and **Power BI** for interactive visualization and reporting.

The Dataset

The core data source is **Bookings.csv**, containing approximately **103,000 ride records** across 19 columns. The key fields are grouped below:

Category	Columns
Trip Details	Date, Time, Booking_ID, Pickup_Location, Drop_Location, Vehicle_Type
Status	Booking_Status (Success / Cancelled by Customer / Cancelled by Driver / Incomplete), Incomplete_Rides_Reason
Performance	V_TAT, C_TAT (vehicle & customer turnaround time), Ride_Distance
Financials	Booking_Value, Payment_Method
Feedback	Driver_Ratings, Customer_Rating

The Problem Statement

The PDF frames two parallel sets of challenges to solve using this dataset:

1. SQL Questions (10 total)

Practical querying tasks that test the ability to filter, aggregate, and rank data, such as:

- Retrieve all successful bookings
- Find the average ride distance for each vehicle type
- Count total rides cancelled by customers
- Identify the top 5 customers by number of rides booked
- Count rides cancelled by drivers due to personal / car-related issues
- Find max & min driver ratings for Prime Sedan bookings
- Retrieve all rides paid for via UPI

- Find average customer rating per vehicle type
- Calculate total booking value of successfully completed rides
- List all incomplete rides along with their reason

The PDF also supplies the answers — written both as direct **SELECT** statements and as reusable SQL **VIEWS** (e.g. `Successful_Bookings`, `Top_5_Customers`, `AVG_Cust_Rating`).

2. Power BI Questions (10 total)

Dashboard and visualization tasks, organized into five thematic views:

View	Visuals
Overall	Ride volume over time, booking status breakdown
Vehicle Type	Top 5 vehicle types by ride distance
Revenue	Revenue by payment method, top customers by booking value, ride distance distribution per day
Cancellation	Cancellation reasons (by customer & by driver)
Ratings	Driver ratings, customer ratings, customer-vs-driver rating correlation

Each question specifies an exact chart type to build — for example, a time-series line chart for ride volume, a doughnut chart for booking status, a stacked bar chart for revenue by payment method, a box plot for driver rating distribution, and a scatter plot comparing customer vs. driver ratings.

Project Deliverables

- **Ola DA Project.pbix** — the completed interactive Power BI dashboard
- **Ola-Slidesuhub.pptx** — a presentation summarizing key findings
- **Ola DA Project DEMO.gif** — a short demo/walkthrough of the dashboard

In Short

The problem asks the analyst to step into the role of a data analyst for OLA: use SQL to answer targeted business questions about ride performance, cancellations, and revenue, and use Power BI to visually communicate those insights across ride volume, vehicle types, revenue, cancellations, and ratings.
